ANIMUSE – Antimicrobial usage in animals in the Asia and the Pacific

Tikiri Wijayathilaka WOAH

t.priyantha@woah.org

ANIMUSE: WOAH's global database on ANImal antiMicrobial USE in

2015

First WOAH data call on antimicrobial use

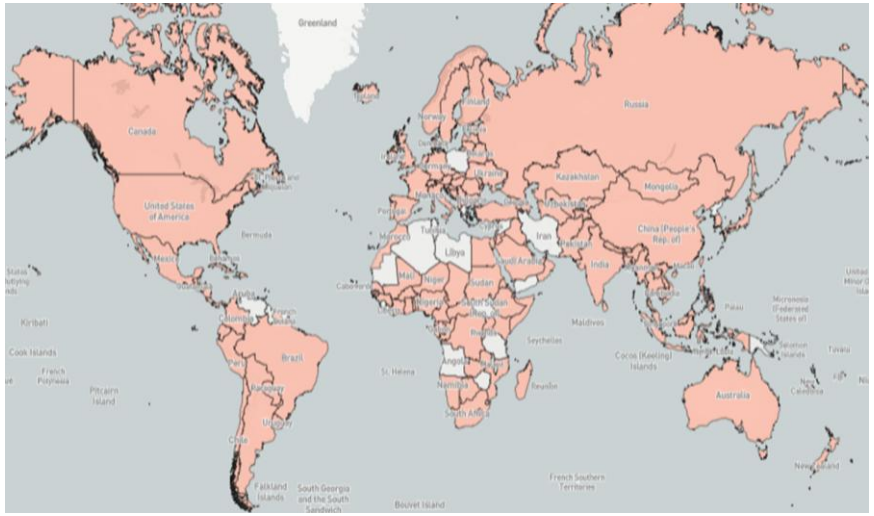
Today : 12th

Data collection round under way (September 2026 – December 2026)

amu.woah.org

One online platform for all WOAH Members

What the data are for



Interpret

Make sense of AMR surveillance data and respond to resistance in a targeted way

Follow trends

See how use changes over time and how it may relate to AMR in animals

Evaluate

Check whether mitigation strategies and policies work

Communicate

Be transparent about risks when data are published

ANIMUSE: the global reference for antimicrobial use in animals

WOAH international standards

Built on the Terrestrial Animal Health Code (chapter 6.9) and the Aquatic Animal Health Code (chapter 6.3) on monitoring quantities and usage patterns of antimicrobial agents

Quadripartite integrated surveillance

The animal-use component of GISSA, alongside GLASS (WHO) and InFARM (FAO)

UN General Assembly, 2024

The political declaration names ANIMUSE for reporting antimicrobial use in animals by 2030 (paragraph 99) and commits to meaningfully reduce use in agrifood systems (paragraph 69)

Reporting to ANIMUSE is how your country reports on its 2030 commitments

The 2024 data report sets the baseline against which progress to 2030 will be measured.

GISSA: Global Integrated System for Surveillance of Antimicrobial Resistance and Antimicrobial Usage. GLASS: Global Antimicrobial Resistance and Use Surveillance System. InFARM: International FAO Antimicrobial Resistance Monitoring.

Six core functionalities, from data to action

1

Questionnaire

Qualitative and quantitative data, entered online or in Excel

2

Calculation Module

Converts product sales or imports into kg of active ingredient (confidential)

3

Animal biomass

WAHIS population data as denominators, to compare use in mg/kg

4

Dashboards

Current and historical data in an interactive report

5

National reports

Report template and a policymaker factsheet built from your data

6

Transparency

You decide whether your national data become public

New in 2026: Reporting Option 4 – antimicrobial use by animal species

ANImal antiMicrobial USE (ANIMUSE) Global Database

Benefits of Reporting AMU Data to ANIMUSE

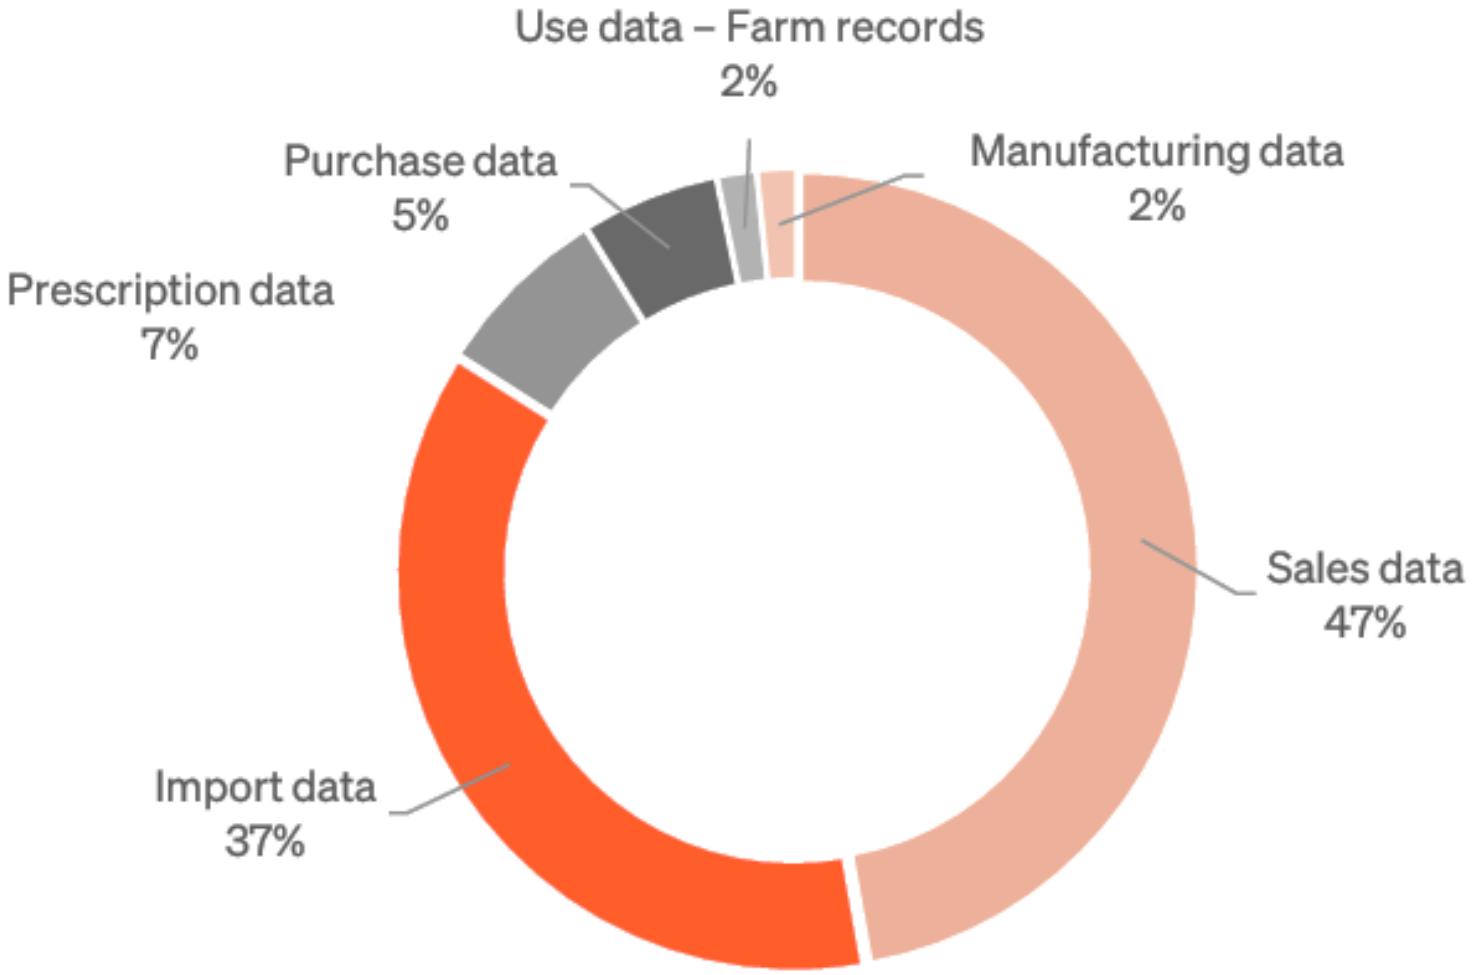
Improves monitoring of antimicrobial use

Supports evidence-based policies & enables benchmarking and global comparison

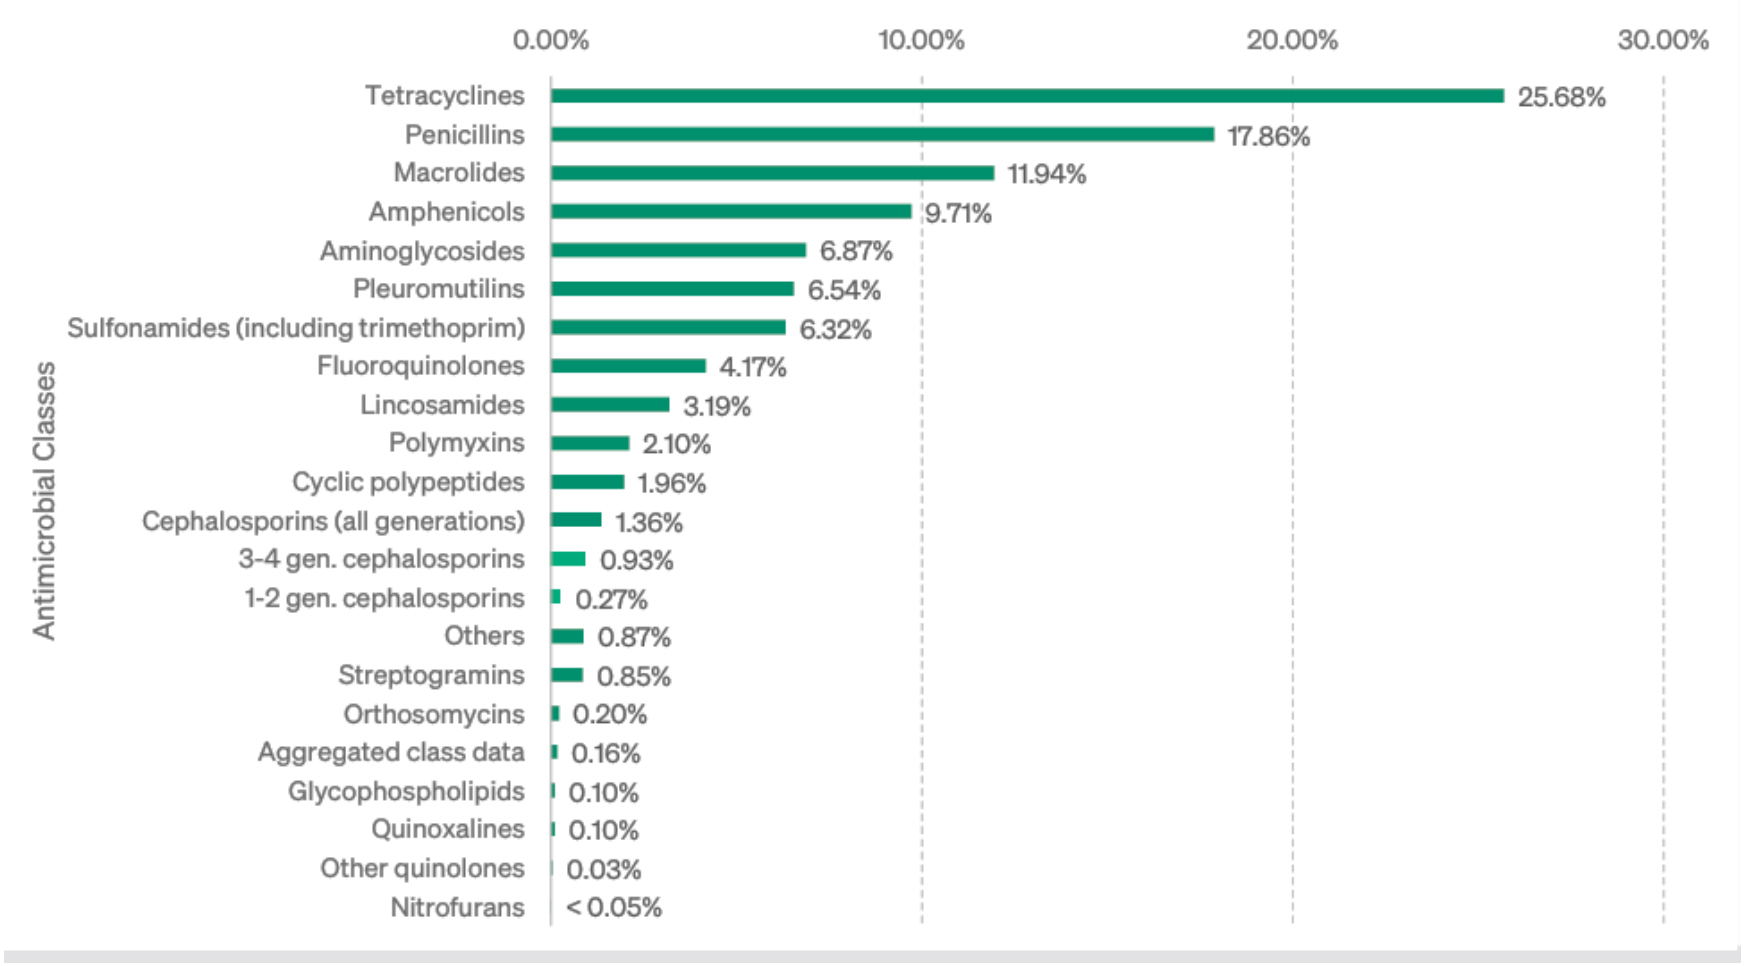
Access to technical support and capacity building

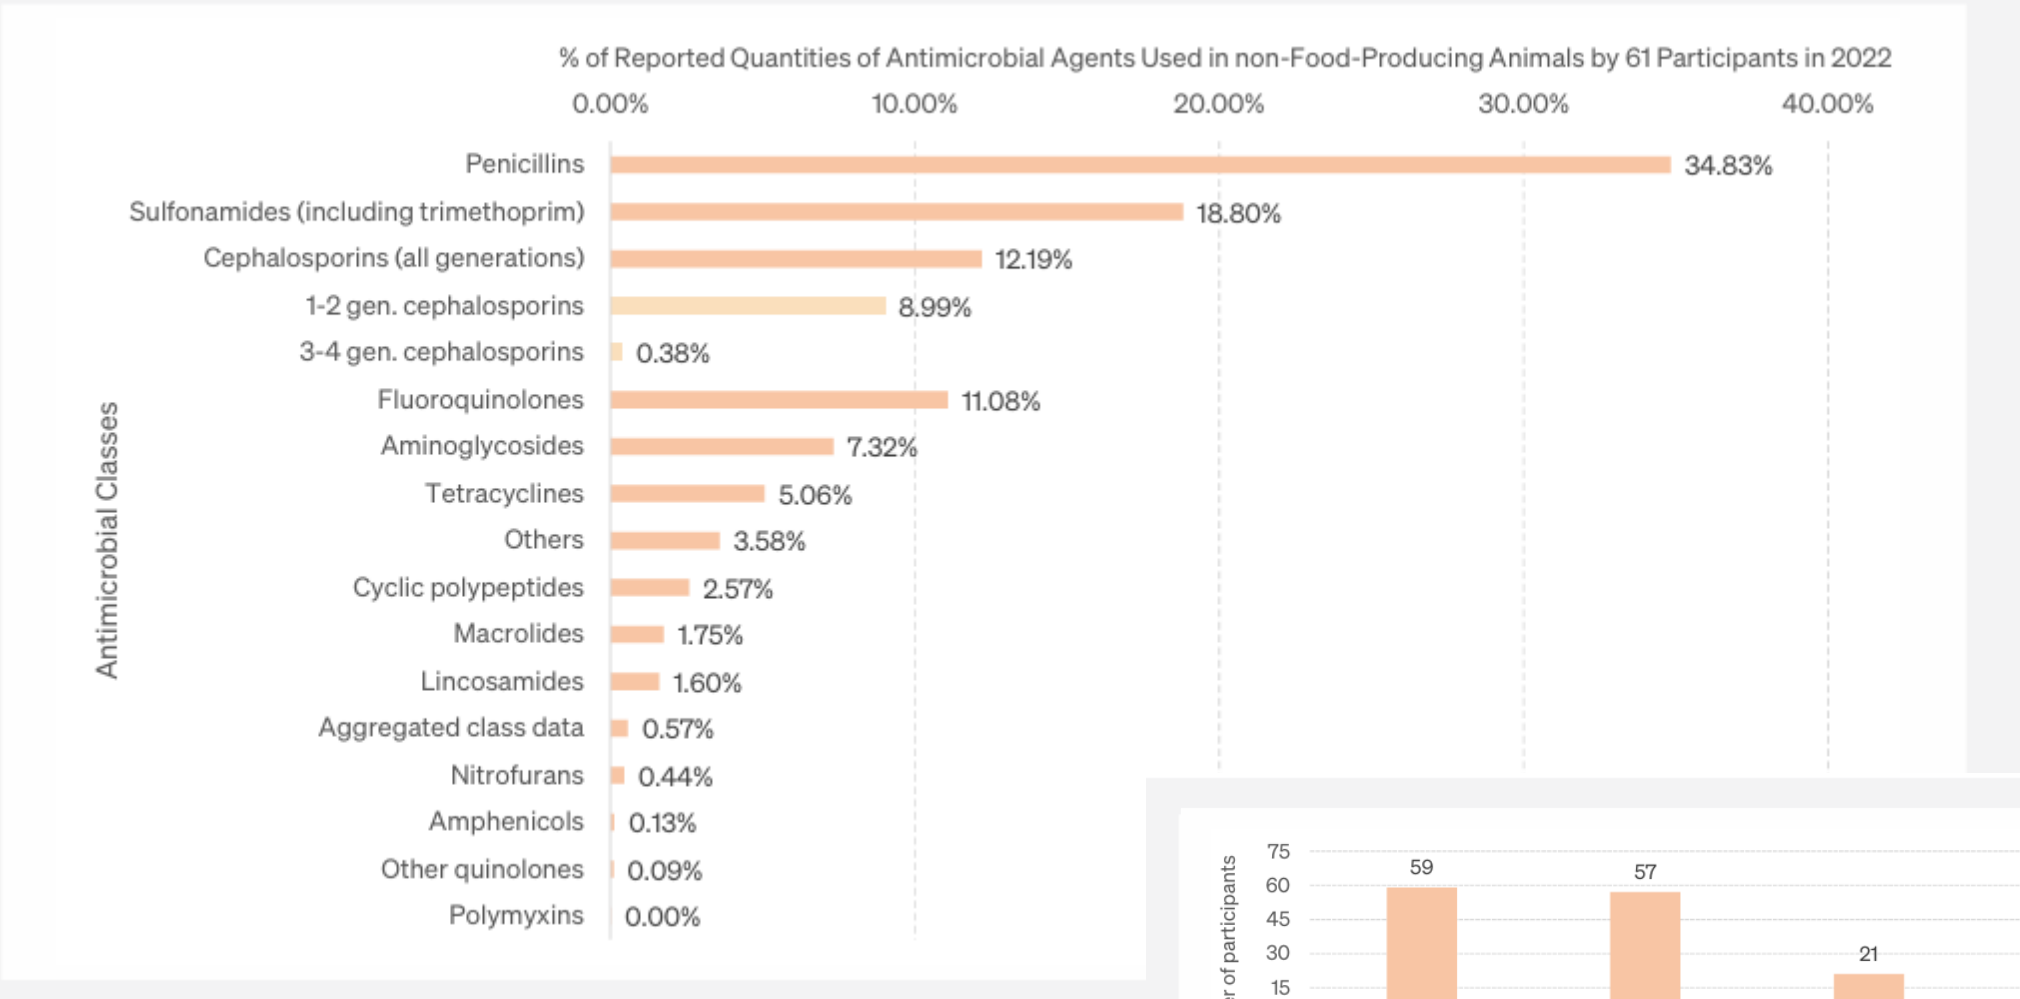
Participating in the system may benefit from technical guidance and training.

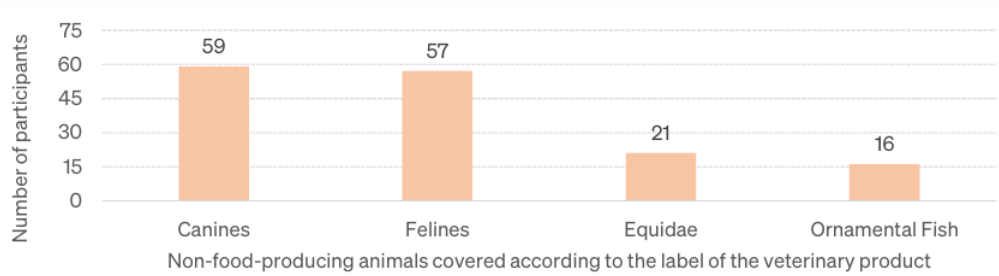
Validated data sources for 107 participants reporting quantitative data in 2022



Proportion of antimicrobial classes by terrestrial food-producing animals as reported by 71 Members in 2022

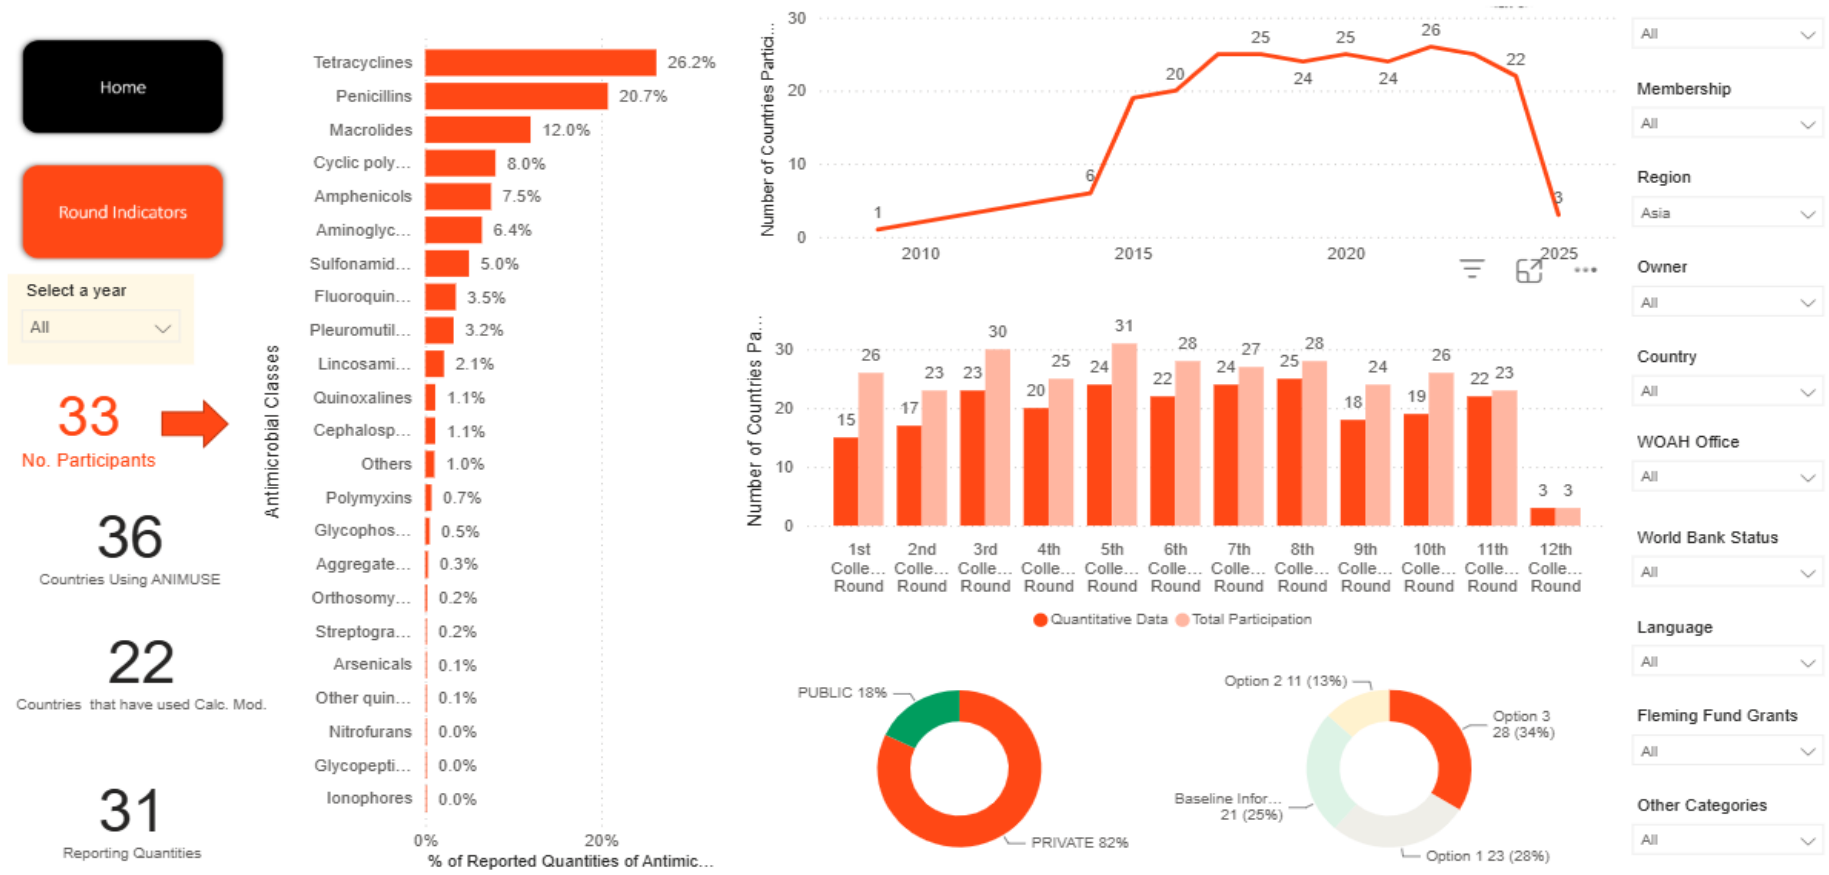






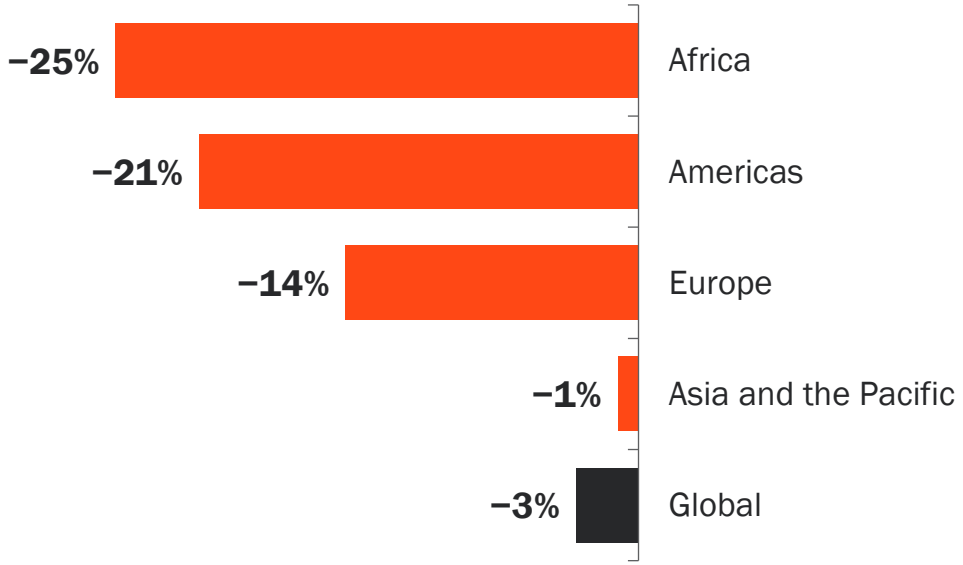
Proportion of antimicrobial classes in non-food-producing animals as reported by 61 Members in 2022

Reporting from Asia Pacific Region



Use fell 3% from 2019 to 2024 – and 25% in Africa

Change in use (mg/kg), 2019–2024, 80 participants



Among the 80 participants

50 **decreased their use**

38 of them by more than 10%

30 **increased their use**

25 of them by more than 10%

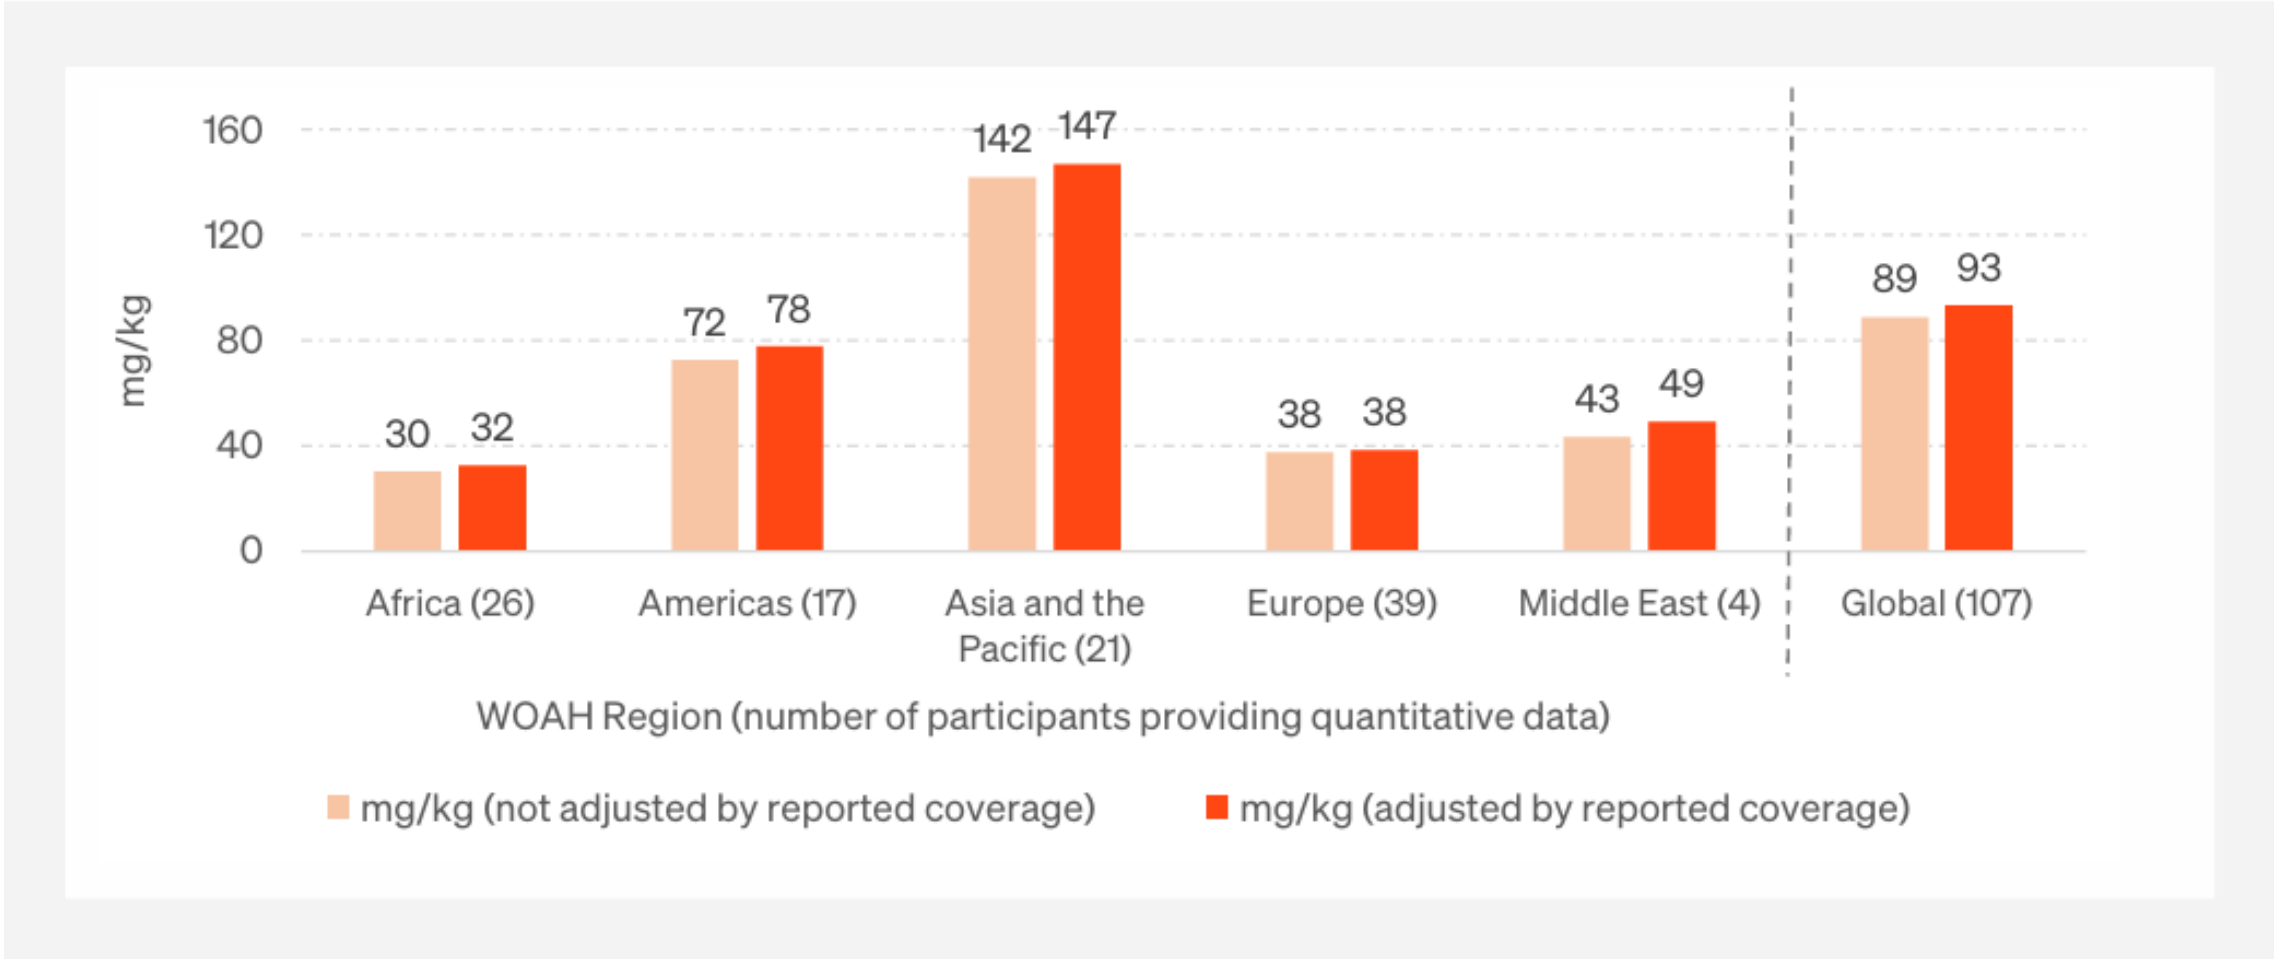
> **a broader analysis of 74 participants shows a 9% increase from 2018 to 2024**

Source: Annual Report on Antimicrobial Agents Intended for Use in Animals (WOAH, November 2026). 80 participants, 55% of global animal biomass in 2024.

Not yet on track for 2030

A 3% fall in five years is far from a meaningful reduction – and use of third- and fourth-generation cephalosporins, highest priority for human health, rose by a third.

Global and regional quantities of antimicrobial agents intended for use in animals based on data reported by 107 participants for 2022, adjusted by animal biomass (mg/kg)



AMR in Companion Animals

WOAH has defined a specific roadmap on AMR in companion animals, based on WOAH's AMR Strategy. The first phase of implementation, planned for 2024-2026, will have two main priorities.

- The first priority is to improve awareness and understanding among companion animal veterinarians and pet owners, in collaboration with key partner organisations such as the World Small Animal Veterinary Association (WSAVA).
- The second priority area is to **strengthen knowledge through surveillance activities,** leading ANIMUSE to become the global reference database for both AMR and AMU surveillance purposes in companion animals, as AMR in these species also fall under our institutional mandate

AMR affects our pets too

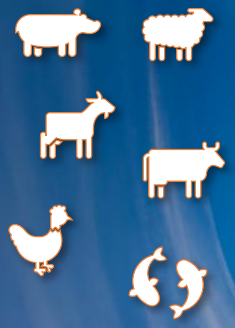
The choices we make...



- Over 1 million people dying every year because of a multidrug resistant bacteria
- US$17 billion annual GDP losses due to multidrug resistant infections in livestock production systems

Year 2026

...can avoid this !

- 39 million people will have died because of a multidrug resistant bacteria
- US$1.7 trillion annual GDP losses due to multidrug resistant infections in livestock production systems

Year 2050

What could be the possible focus?

Reducing the antimicrobial use in animals may reduce the chances of developing AMR

How can we do it?

Reduce

- Set targets to reduce the use of critically important antimicrobials
- Responsible and prudent use
- Use antimicrobials only when necessary

Replace

- Consider using alternatives
- Research on new alternatives
- New legal frameworks – Authorization of alternatives

Rethink

- Improve prevention and control of diseases in animals – Good Farming Practices
- Alternative farming systems
- Improve awareness and education – Change risk behaviors through awareness

Thank you !

Merci !
