

# WHO Integrated Global Surveillance on ESBL Producing E coli Tricycle – Epi X Project

OIE Sub Regional Conference, March 7, 2019. Bangkok

David Sutherland (WHO-SEARO) on behalf of:

Manish Kakkar (WHO-SEARO) and  
RJ Soares Magalhaes (University of Queensland)

# Outline

- Background
- Introduction to Tricycle project
  - Aim and objectives
  - Main features
  - Work packages
- Tricycle - Epi X protocol
  - Design and stages
- Tricycle – Epi X in Jakarta
- Summary

# Background

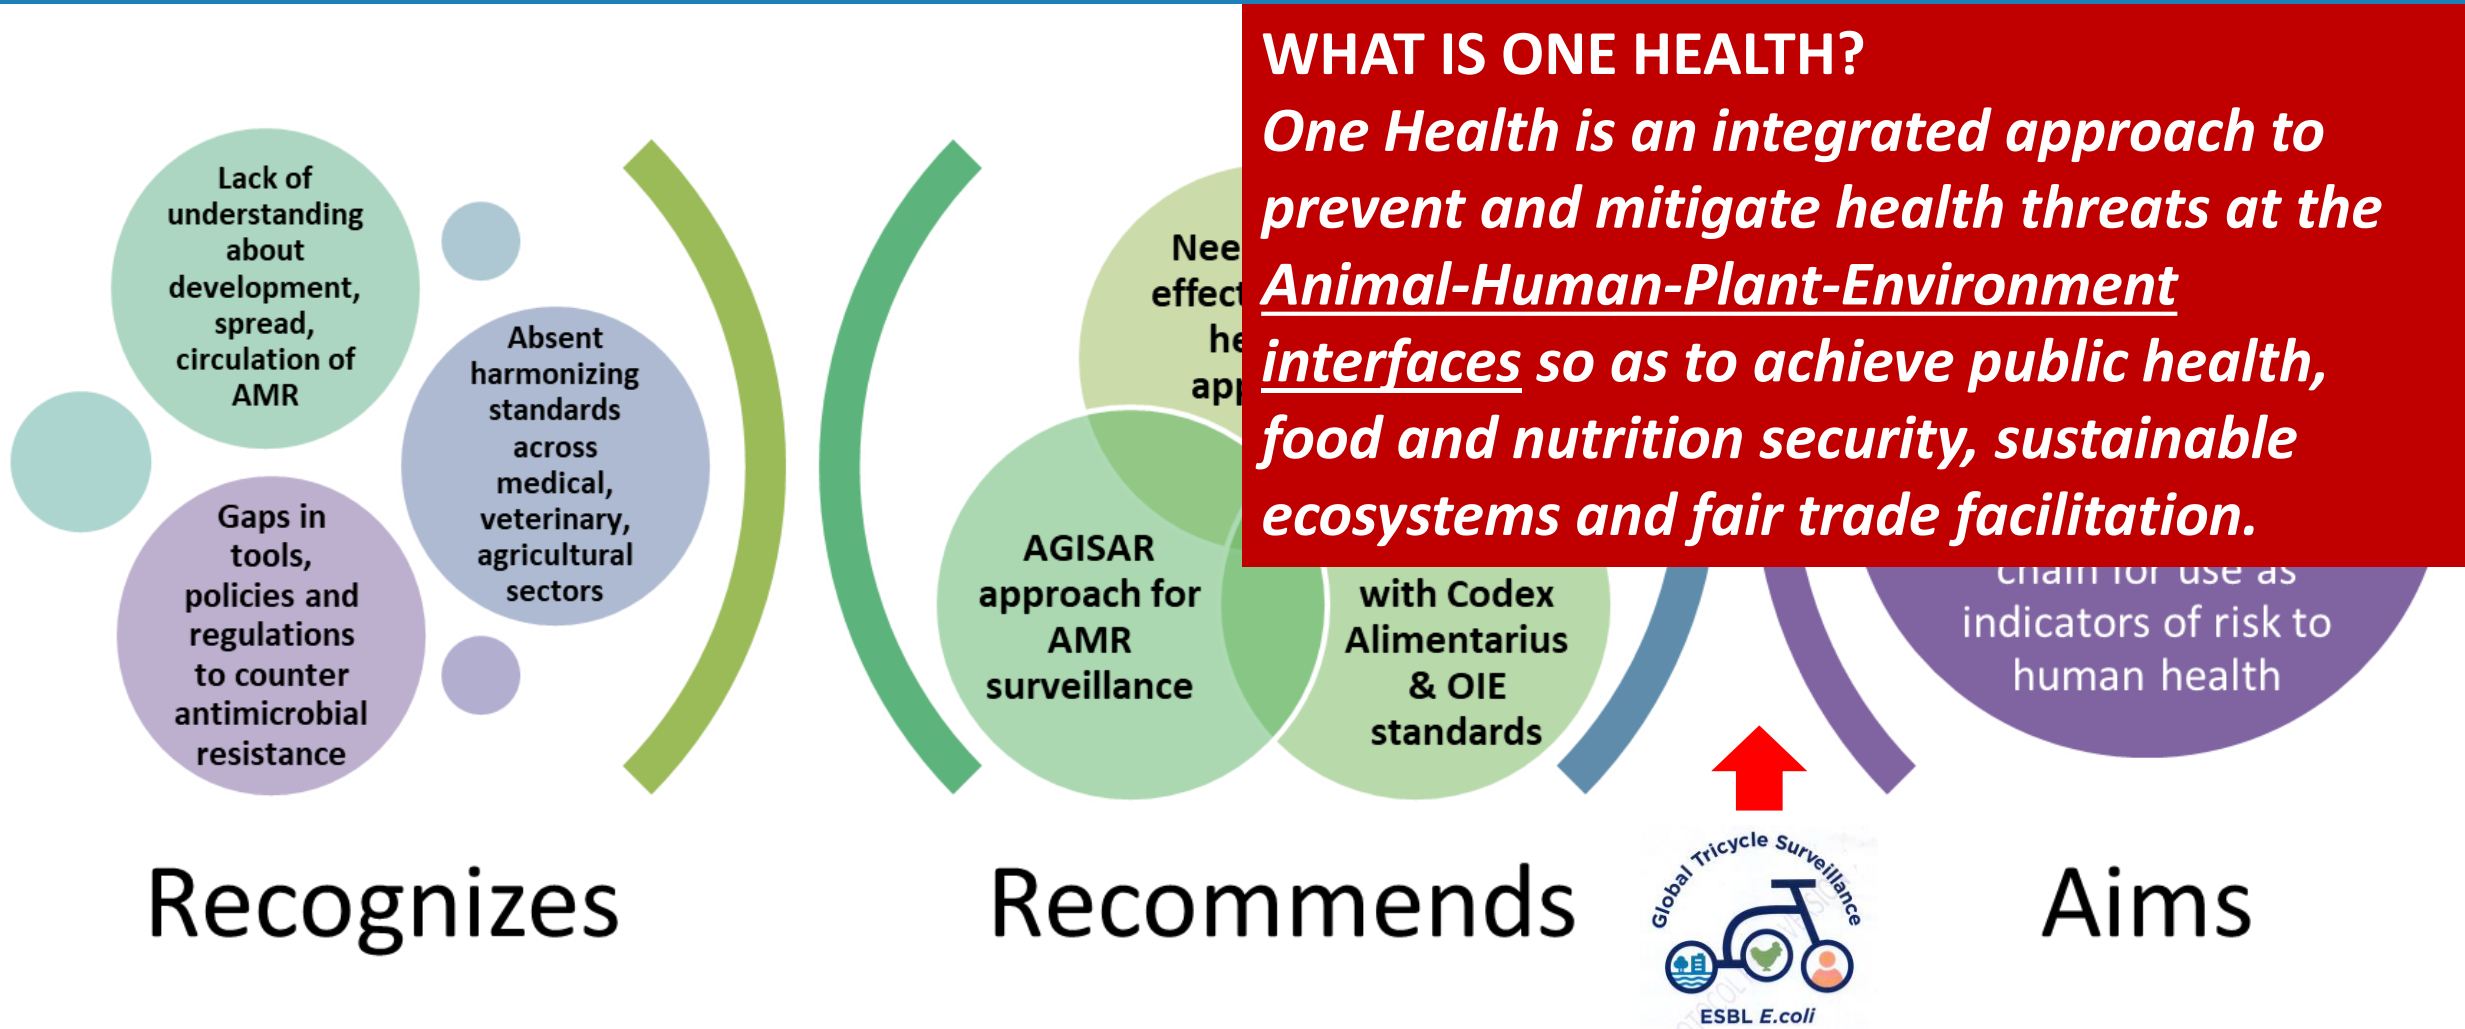

- 68<sup>th</sup> WHA in 2015 adopted the Global Action Plan (GAP) on AMR; expected to translate into National Action Plans (NAP) by May 2017
- GAP recommends development of NAP that is comprehensive, holistic, collaborative and imbibes One Health approach
- WHO's obligations: to report on the development, implementation, monitoring, and evaluation of the national action plans for the containment of AMR developed by member states

## Strategic objectives of GAP AMR

1. Improve awareness of AMR
2. **Strengthen knowledge through surveillance and research**
3. Infection prevention control measures, including WaSH
4. Optimise use of AMAs in animal and human health
5. Economic case for sustainable investment

# GAP: Emphasizes 'Integrated' One Health surveillance

# AGISAR\*-WHO's Global Survey on ESBL procuring E coli project: "Tricycle" Project

- AGISAR and the Food Safety and Zoonoses Department of WHO developed the Tricycle Project
- Tricycle implies **simultaneously addressing three aspects of bacterial resistance** - human health, food chain and the environment
- Comprises of **epidemiological and microbiological procedures** specifically designed to be conducted in harmonised manner in all countries
- Data gathered on AMR, antimicrobial use, demographics and molecular characteristics to explore pathways of dissemination
- To be rolled out globally by Member States as **part of the Global Antimicrobial Resistance Surveillance System (GLASS)**

# Tricycle project: aim and objectives

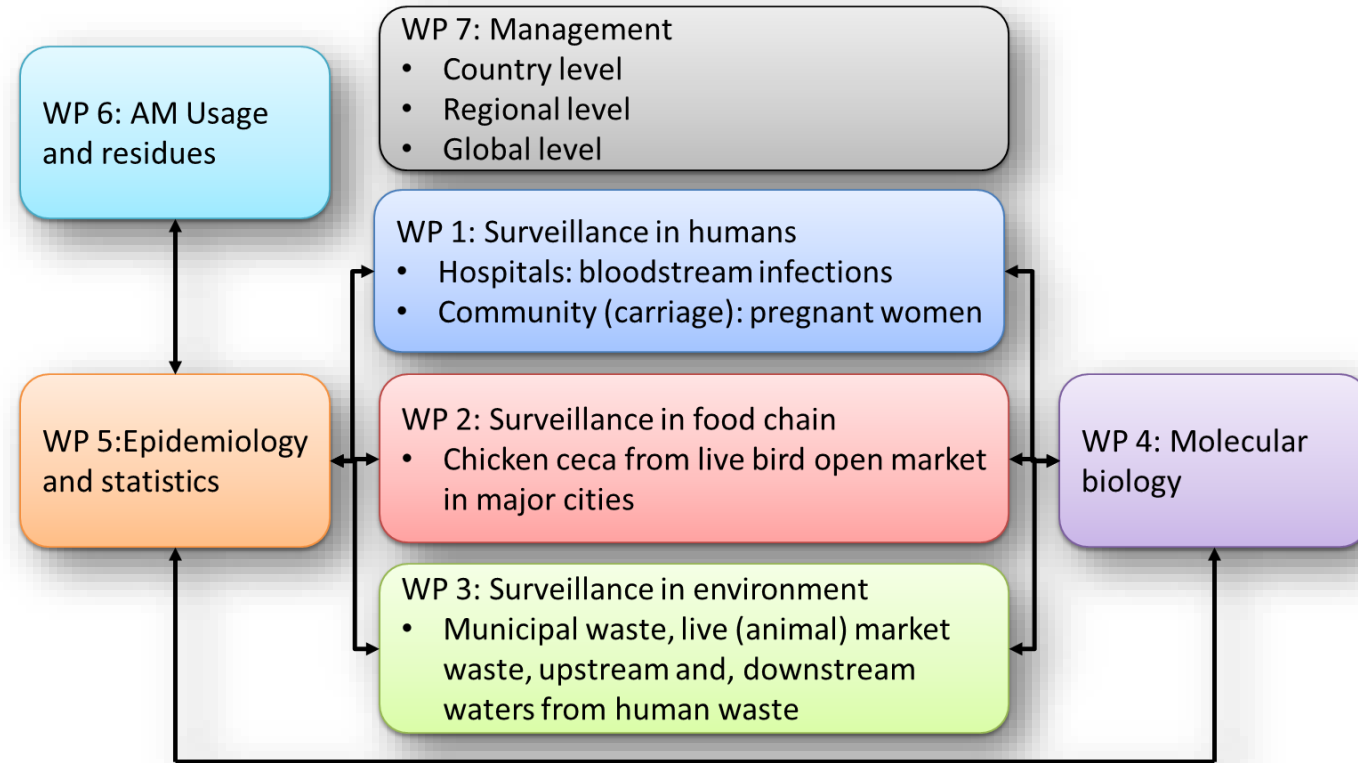

- Aim:
  - **Support the development of the National Integrated Surveillance System on AMR in Member States**
- Objectives
  - **Establish an Integrated Surveillance system** to monitor ESBL producing E coli in three main areas, human, food, and environment across Member States
  - **Establish a simple and standardized methodology** to isolate and monitor ESBL producing E coli
  - **Compare the prevalence of ESBL E coli in each of the three sectors** among Member States
  - Have a **longitudinal system in place** to assess effect of interventions

# Tricycle project: main feature

- Focuses on single key indicator – frequency rates of ESBL-Ec measured yearly under identical and controlled conditions in humans, food chain and environment
- Why ESBL Ec?
  - Severe morbidity, mortality and economic burden; often linked to AMU in food chain
  - Great variation in colonization rates and prevalence in humans and animals
  - Decrease in rates in response to decrease use
  - Relevant and representative proxy for magnitude and leading edge of AMR problem
  - Role of different sectors in emergence and spread unclear

# Tricycle project: work packages

- **Work package 1: ESBL Ec in humans**
  - Hospitals with blood culture positive with E coli (blood culture)
  - Pregnant women otherwise healthy and close to delivery (faecal sample culture)
- **Work package 2: ESBL Ec in food chain**
  - Wet bird market (chicken slaughterhouse when no wet bird market) (cecal contents)
- **Work package 3: ESBL Ec in Environment**
  - Major (capital city) and sentinel city (100,000 population) with presence of river
  - Four sample types: upstream, downstream, wet market/harvest facility (WP2), and communal waste

# Tricycle – Epi X Protocol

Tricycle project  
with expanded  
epidemiological  
study design

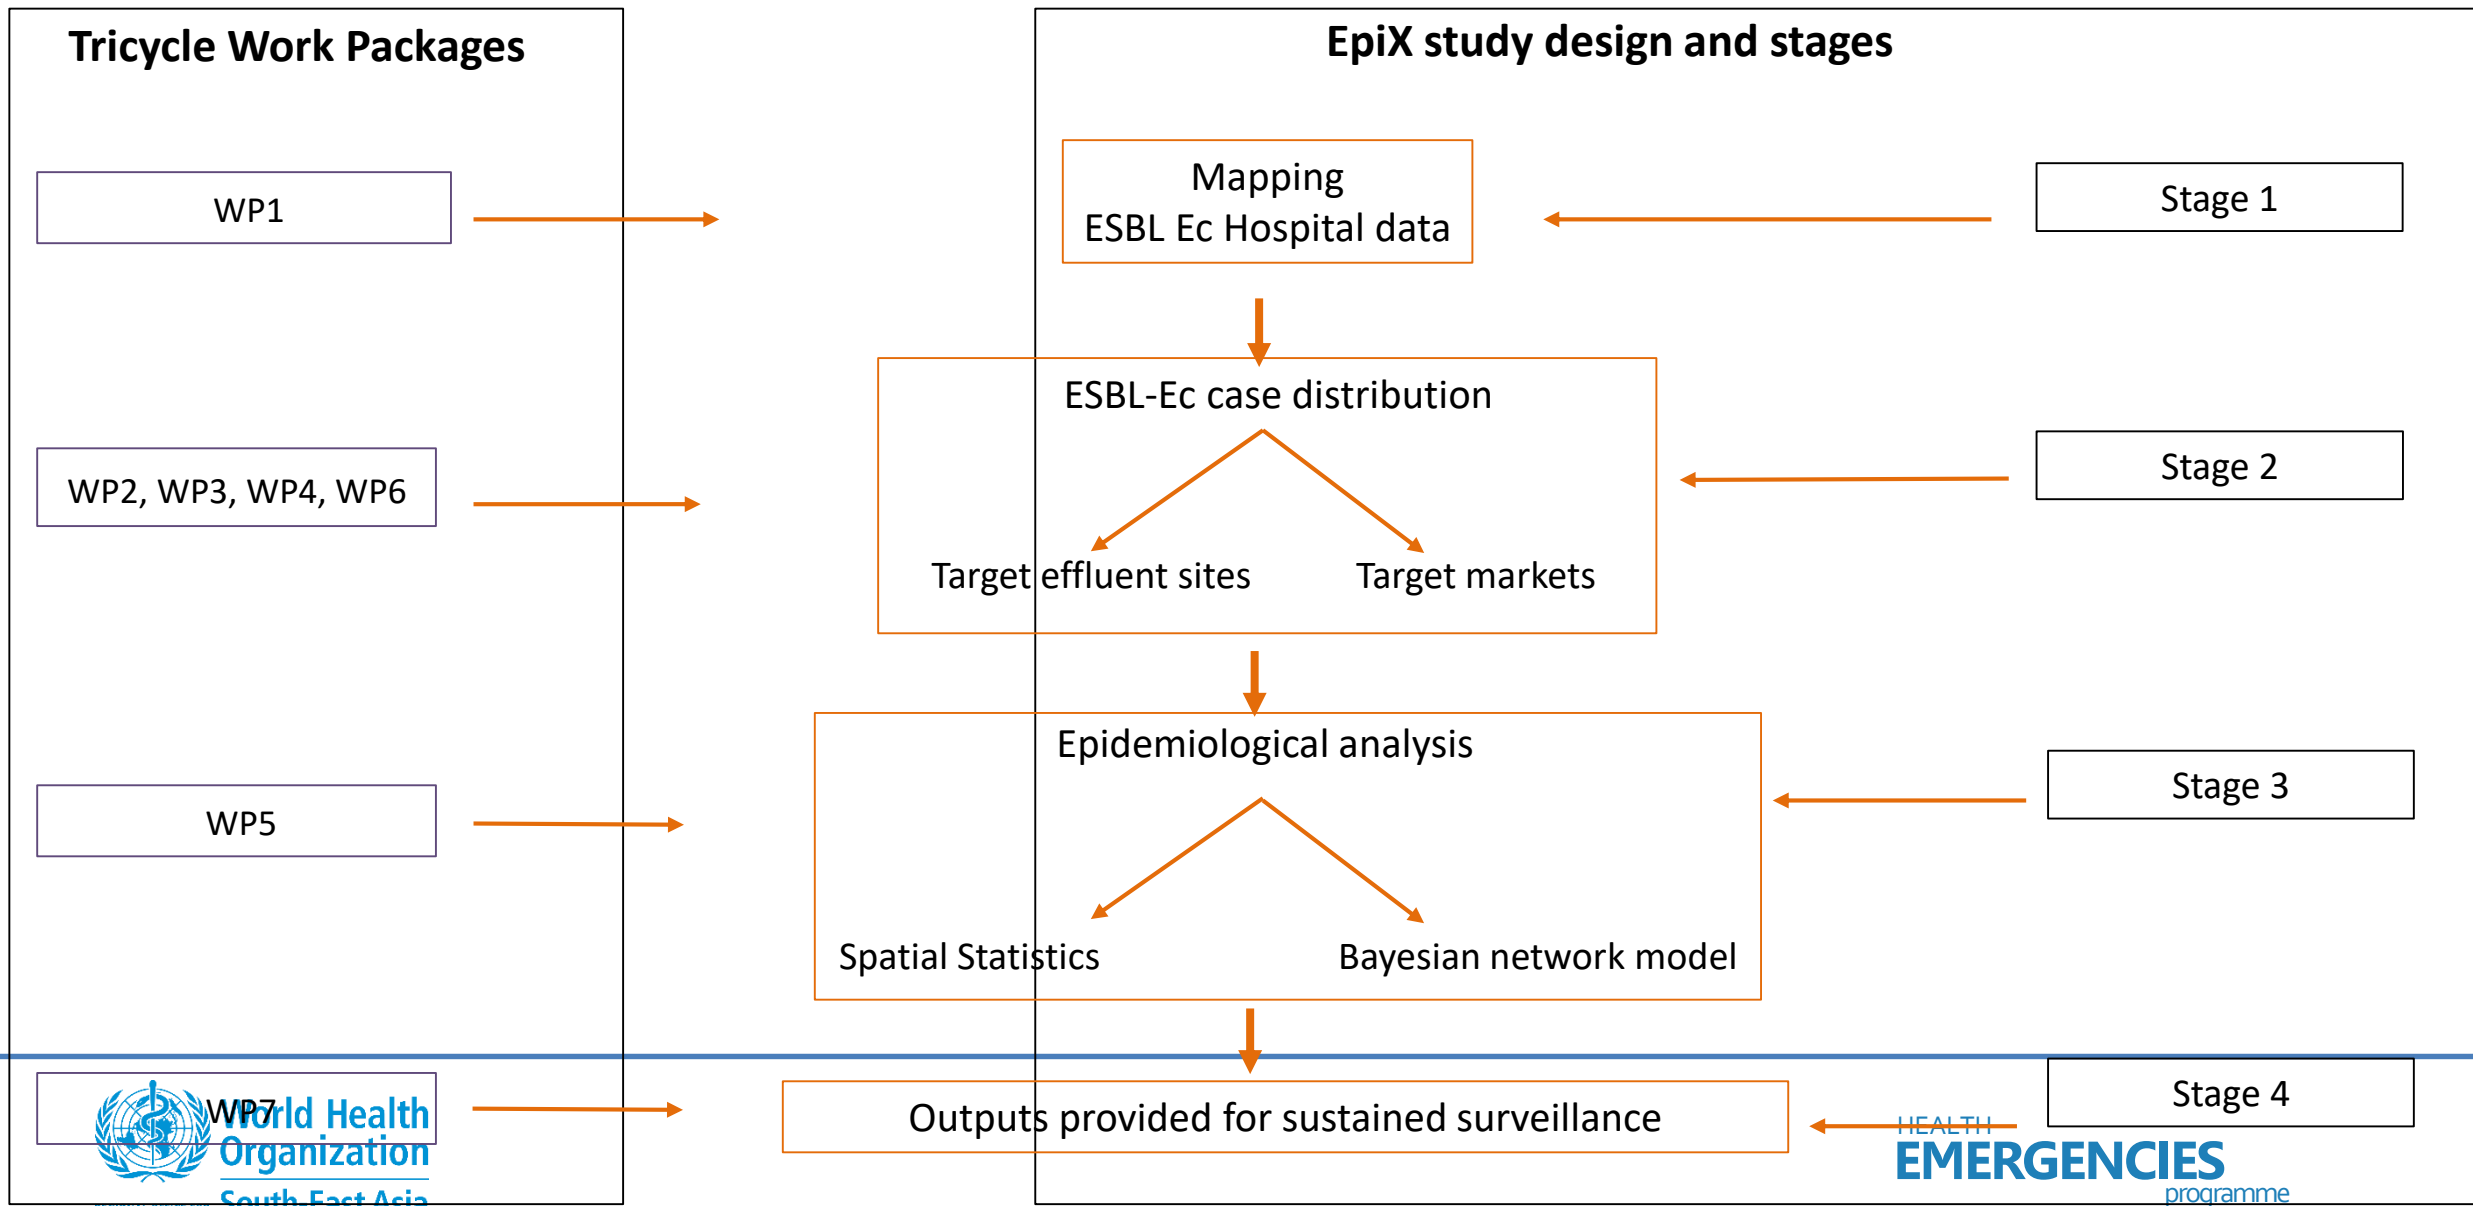

## Main considerations

- Accomplish the tasks in each of the WHO-T WP's
- A study design to be able to identify transmission pathways across the three sectors.
- An analytical framework to measure indicators for long-term surveillance sites to monitor transfer and emergence of AMR

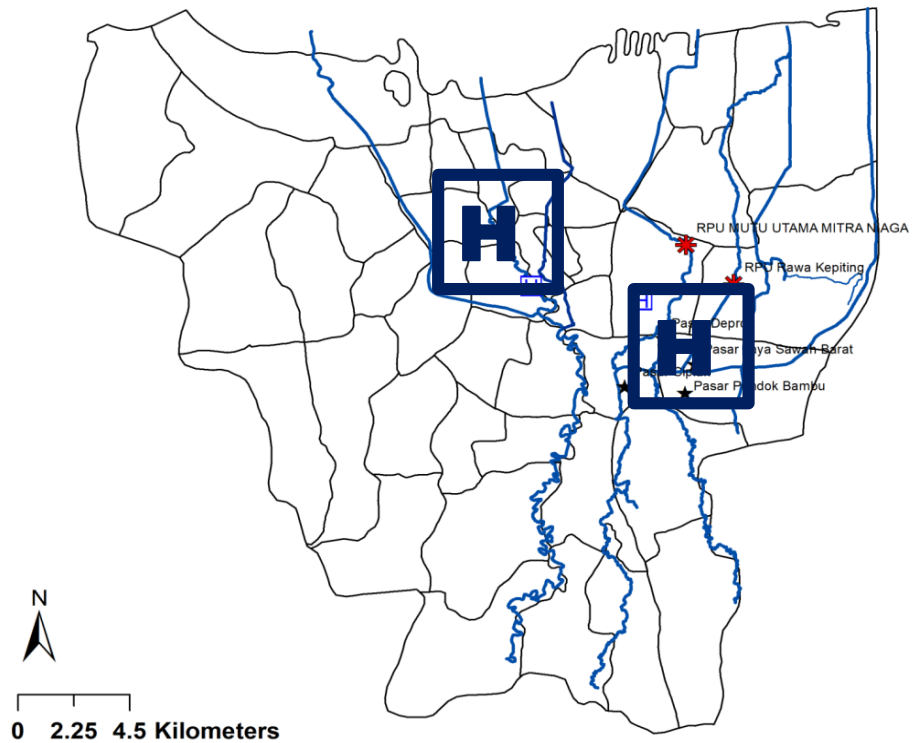

***Tricycle- Epi X protocol is currently being implemented  
in three cities in SEAR: Jakarta, Kolkata and Kathmandu***

# Tricycle - EpiX study framework

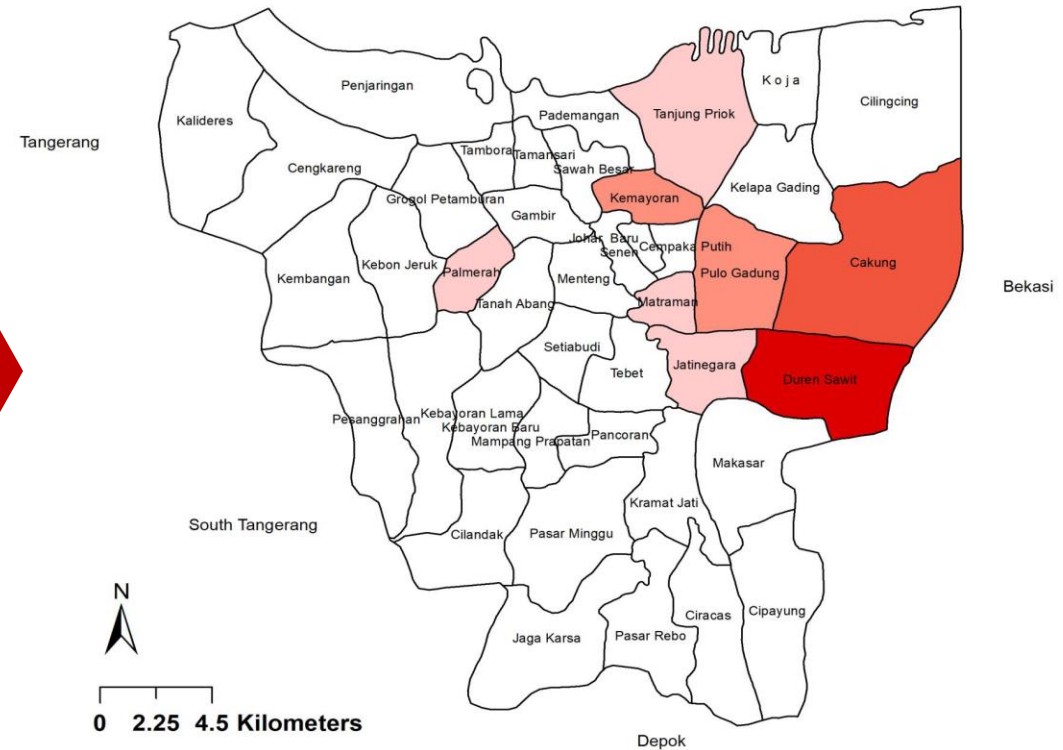

# Epi X study design: stage 1

Enrolment of **Hospitals**, collection of historical ESBL-Ec human cases

Mapping, identification of **hotspots**

# Epi X study design: stage 2

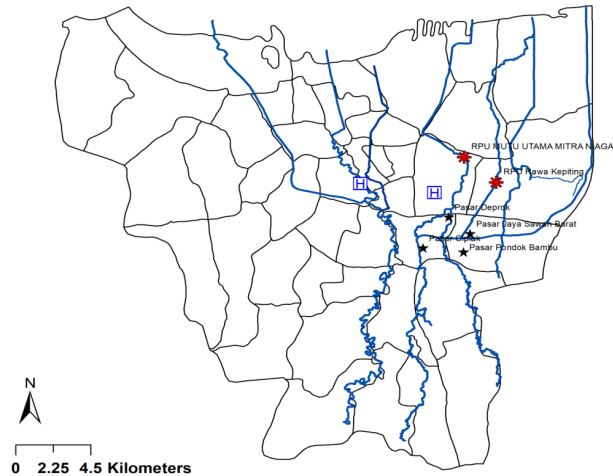

## Selection of **Markets** and **effluent sites**

From the  
hotspots  
analysis

# Epi X study design: stage 3 (Epidemiological analysis pipeline)

**Map geographical risk of ESBL-Ec and identify environmental drivers of transmission**

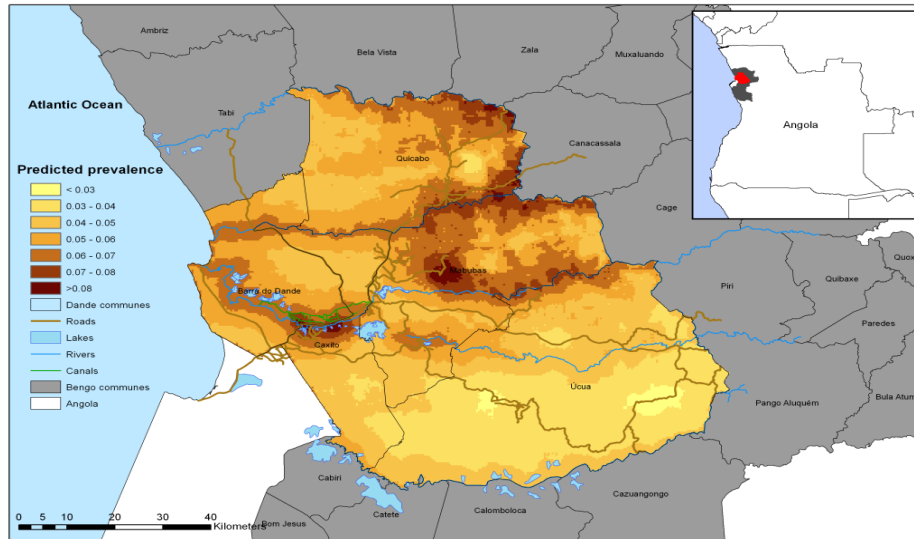

**Track the spread of ESBL-Ec within and between human, animal and environmental populations in concurrent and sympatric settings**

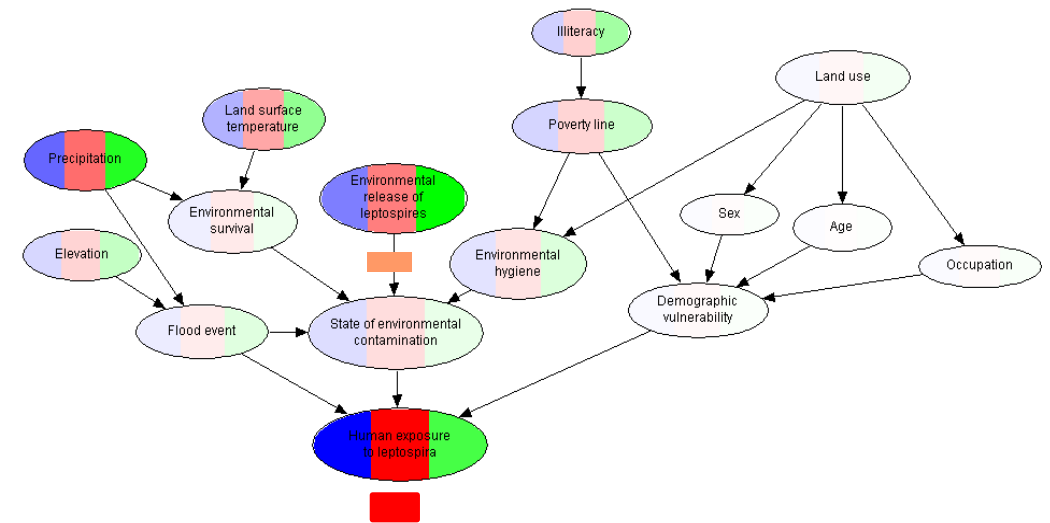

# Epi X study design: stage 3 (Epidemiological analysis pipeline)

Identify factors playing central role in seeding transmission clusters

Spatial effects and predictive maps

Spatial Bayesian network models

# Epi X study design: stage 3 (Epidemiological analysis pipeline)

**Estimate population  
specific transmission  
and evolutionary rates**

**Assess the emergence  
and evolutionary  
trajectories of AMR  
capabilities**

# Epi X study design: stage 4 (Outputs for sustained surveillance)

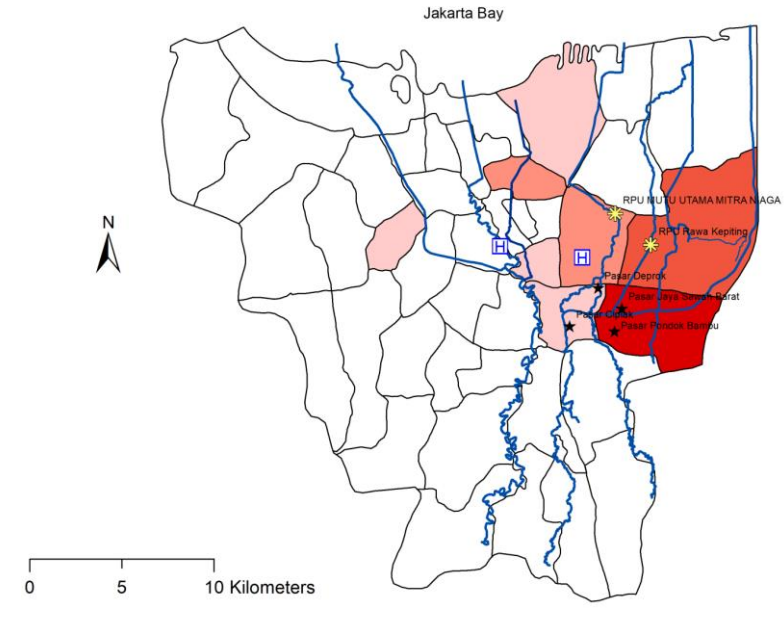

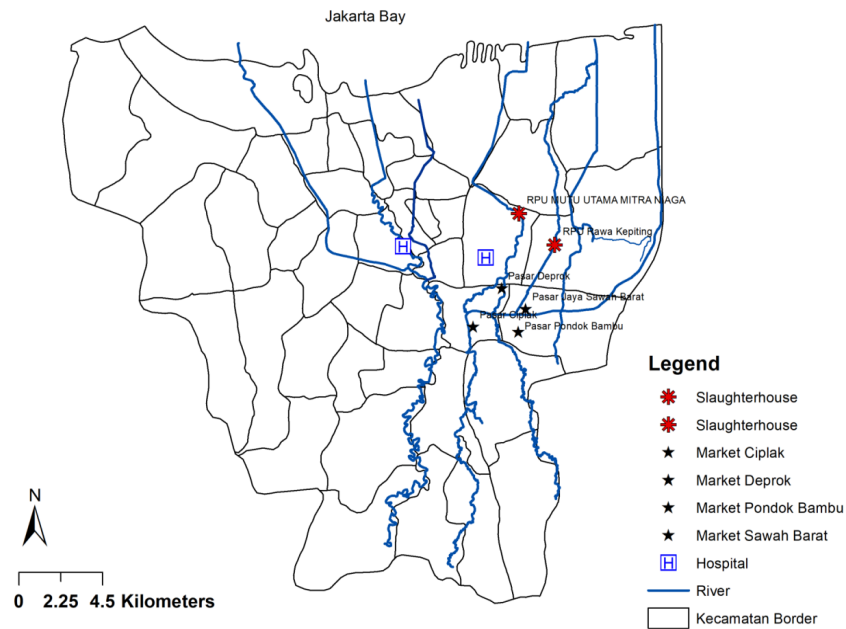

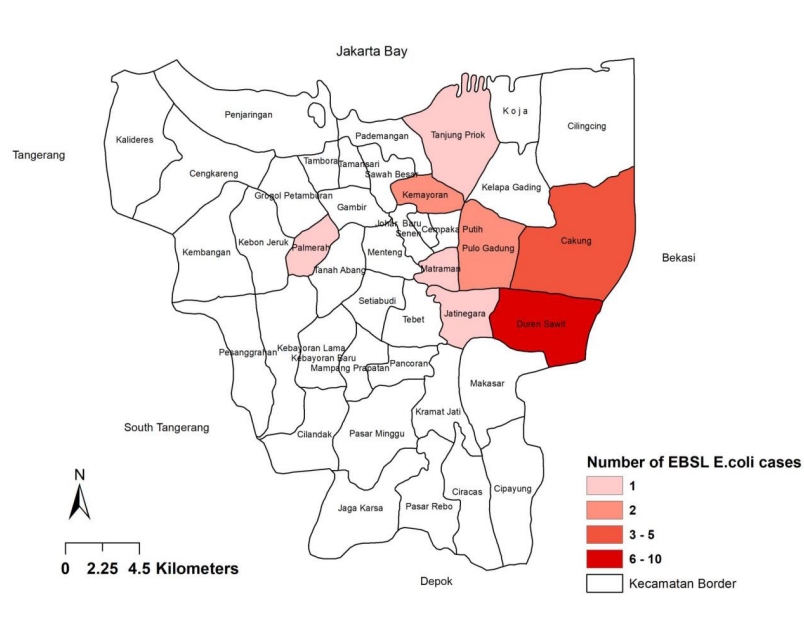

- Mapping geographical risk of ESBL-Ec
- Identification of the environmental drivers of transmission
- Indicators of risk of the spread of ESBL-Ec intra and inter species
- Identification of the evolutionary drivers of ESBL-Ec

# TRICYCLE – EPI X IN JAKARTA

# Jakarta – Stage 1 and Stage 2

Enrolment hospitals, human ESBL-Ec data, hotspots analysis, selection of markets / effluent sites

# Epi X Sampling Protocol – Jakarta

# Jakarta: Sampling protocol

Tricycle	Epi X
<p>Human</p> <ul style="list-style-type: none"><li>• 100 blood cultures positive for ESBL Ec</li></ul>	<p>Human</p> <ul style="list-style-type: none"><li>• 100 blood cultures positive for ESBL Ec</li><li>• <b>1 main pre-treated hospital sewage sample per 2 months</b></li></ul>
<p>Food sample</p> <ul style="list-style-type: none"><li>• 240 fresh poultry (cecum) samples over 12 months from 10 markets</li></ul>	<p>Food sample</p> <ul style="list-style-type: none"><li>• 240 fresh poultry (cecum) samples over 12 months from <b>8 markets</b></li></ul>
<p>Environment</p> <ul style="list-style-type: none"><li>• 48-64 samples per year</li></ul>	<p>Environment</p> <ul style="list-style-type: none"><li>• 48-64 samples per year</li></ul>

# Jakarta: Risk factor data

## Human cases (and pregnant females)

- Age, Gender, Location (address), **Educational status and years of education**
- Department, Institution
- Isolate number, ESBL Screening result, Isolate ID confirmation, AST results
- Invasive procedure and antibiotic consumption history
- **SES including drinking water and toilet**
- **Animal rearing and poultry housing**
- **Antibiotic use in poultry and frequency of use**
- **Effluent treatment of animal waste**

## Food chain

- Market name
- Specimen number, sample type, market name, sample collection date
- Isolate number, ESBL Screening result, Isolate ID confirmation, AST results
- Average slaughter rate
- **Age, Gender, Location (address), Educational status and years of education\***
- **Poultry stunning and bleeding, scalding, viscera disposal\***
- **Biosecurity and disinfection\***
- **Source of poultry<sup>§</sup>**

## Environment

- Sample site,
- Sample number, collection round number, sample type, sample collection date
- Isolate number, ESBL Screening result, Isolate ID confirmation, AST results
- E coli concentration, ESBL concentration, ESBL/E coli ratio

*\* Information to be collected only on first visit; <sup>§</sup> Information to be collected on all follow up visits*

# Summary

- GAP recognizes integrated One Health AMR surveillance as a strategy for effective response to AMR
- Tricycle-Epi X protocol is a simple, robust and standardized model in line with above strategy
- Tricycle-Epi X protocol is proposed to provide insights into AMR trends, hotspots of emergence & spread and pathways of AMR transmission within and between sectors to inform targeted control of AMR

# Acknowledgments
