1. Introduction

- Misuse and overuse use of antimicrobials can accelerate emergence and spread of antimicrobial resistance (AMR).
- In 2019, 1.27 million people died of AMR-related bacterial infection worldwide. \bullet
- Currently, there is a lack of AMR data and general awareness on AMR in Cambodia.
- Under the AMR Multi-Partner Trust Fund (MPTF), the General Directorate of Animal Health and Production (GDAHP), with technical and financial support of World Organisation for Animal Health, Regional Representation for Asia and the Pacific (WOAH RRAP) implemented activities on AMR and antimicrobial usage (AMU) from 2021 to 2023.
- Key objectives were to enhance understanding of AMR risks, enhance awareness amongst key stakeholders and strengthen responsible use of antimicrobials in livestock sector.

Drug-resistant pathogens can spread between and within animals, humans, plants and through the environment.

The GDAHP implemented the activities following signing of a letter of agreement with WOAH RRAP.

2. Key Achievements

- 2.1 National AMR Communication Strategic Plan (NACSP) of Cambodia 2024-2026
- The NACSP outlines the key strategies and activities for effective communication on AMR and AMU in human, animal, and environment sectors.

2.3 Enhancing awareness on AMR at all levels of AMU supply chain

Several awareness events on the responsible use of antibiotics at the national, sub- \bullet national and community levels undertaken across Cambodia in 2021, 2022, and 2023 during World AMR Awareness Week (WAAW).

2.4 Effectively engaging the private sectors – the game changer in addressing AMR

Seminars on good animal husbandry practices and advocating national legislations and WOAH Standards on AMR/AMU to animal producers, importers and distributors of veterinary medicines.

2.2 Development of awareness materials on AMR

- A total of 2 animated videos, 6 posters, 4 leaflets, and 3 social media infographics were developed to provide strategic messages on responsible use of antimicrobials in animals and to create public awareness on AMR.
- Messages highlighted the roles, each stakeholder, from policy makers to end users of antibiotics, can play in addressing AMR.

POULTRY FARMERS

How can you help address antimicrobial resistance?

35

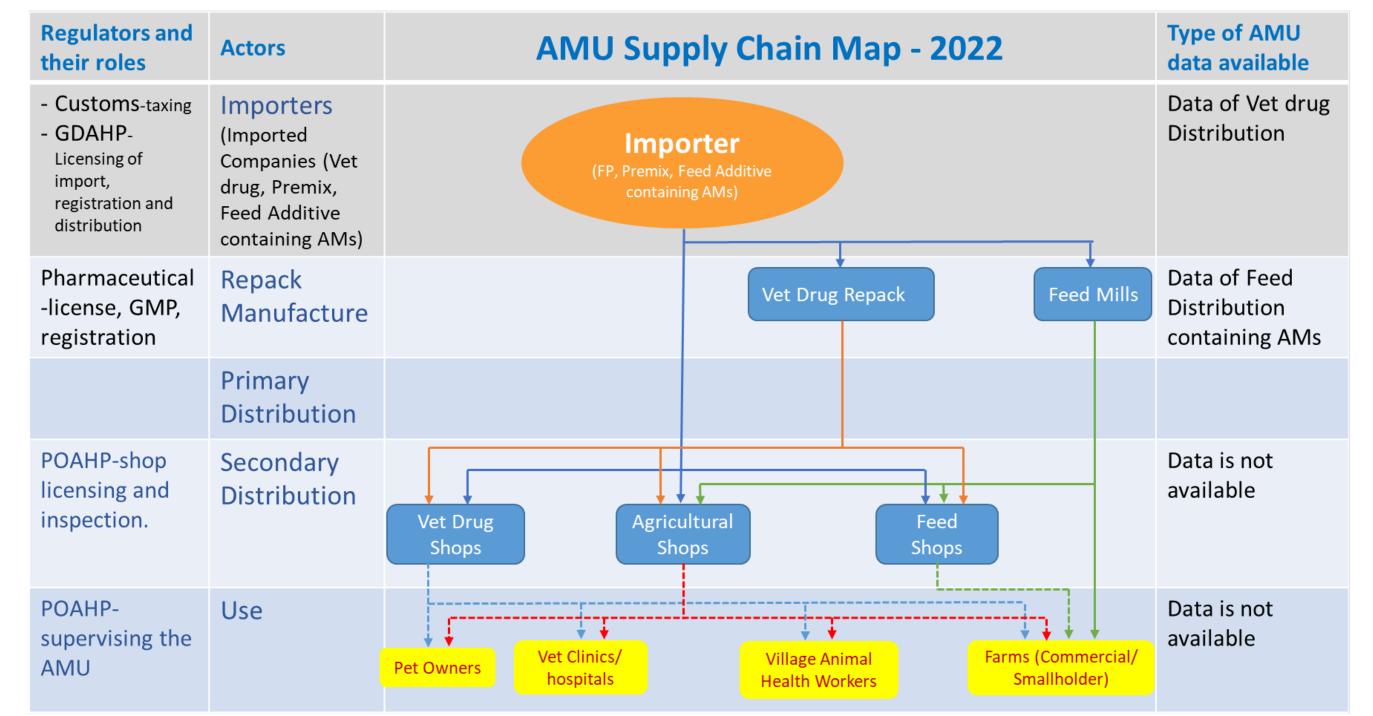

You can reduce unnecessary use of antibiotics in your poultry farms and save costs

In line with WOAH's Standards on monitoring of antimicrobials, GDAHP revised their AMU Supply Chain of 2018 through consultation with the private sector in 2022.

3. Lessons learned

1. The AMR MPTF Project led by WOAH, WHO and FAO (the "Tripartite") was a truly One Health initiative that enhanced coordination and collaboration between the human health, animal health and environment sectors in Cambodia.

- WHAT IS ANTIMICROBIAL **RESISTANCE (AMR)?** MR occurs when antibiotics are no longer effective i reating bacterial diseases in humans and animals AMR is widely prevalent in Cambodi It is therefore important to preserve the efficacy and availability of antibiotics for effective treatment of You can help reduce AMR by: · Ensuring staff are adequately trained in handling antibiotics Using only registered antibiotics or those dispensed from authorised sources Properly storing antibiotics as per manufacturers' instructions · Selling antibiotics only with a prescription by a competent veterinariar Maintaining proper records of antibiotics sold Sharing data on sold antibiotics with government regulators Safely disposing of unused or expired antibiotics and their containers You can help reduce AMR through the responsible sale of antibiotics in Camb World Orga
- 2. The MPTF Project raised awareness on the importance of AMR and use of a One Health approach at the highest level. It has catalysed government and donor interests on One Health activities in Cambodia.
- 3. Capacity on AMR communication and AMU monitoring enhanced within GDAHP.
- 4. A successful project implementation mechanism between GDAHP and WOAH RRAP.
- 5. Three years is a short time frame to measure the actual impact of interventions. GDAHP, MAFF is interested in continuing activities if a second phase MPTF is available.
- There is a need for awareness activities to reach sub-national levels and 6 communities to bring positive behavioural changes in the use of antimicrobials in animals.

Acknowledgements: WOAH RRAP, Tokyo Japan for technical support in conceptualization, planning and implementation of activities. Thanks to the MPTF Secretariat and Donors for funding support. Thanks to the Ministries of Health and Environment, FAO, WHO and other partners for their support and collaboration.
